## Features

- High-performance, Low-power AVR<sup>®</sup> 8-bit Microcontroller
- RISC Architecture
  - 130 Powerful Instructions – Most Single Clock Cycle Execution
  - 32 x 8 General Purpose Working Registers
  - Fully Static Operation
  - Up to 16 MIPS Throughput at 16 MHz
  - On-chip 2-cycle Multiplier
- Nonvolatile Program and Data Memories
  - 8K Bytes of In-System Self-programmable Flash  
Endurance: 10,000 Write/Erase Cycles
  - Optional Boot Code Section with Independent Lock Bits  
In-System Programming by On-chip Boot Program  
True Read-While-Write Operation
  - 512 Bytes EEPROM  
Endurance: 100,000 Write/Erase Cycles
  - 512 Bytes Internal SRAM
  - Up to 64K Bytes Optional External Memory Space
  - Programming Lock for Software Security
- Peripheral Features
  - One 8-bit Timer/Counter with Separate Prescaler and Compare Mode
  - One 16-bit Timer/Counter with Separate Prescaler, Compare Mode, and Capture Mode
  - Three PWM Channels
  - Programmable Serial USART
  - Master/Slave SPI Serial Interface
  - Programmable Watchdog Timer with Separate On-chip Oscillator
  - On-chip Analog Comparator
- Special Microcontroller Features
  - Power-on Reset and Programmable Brown-out Detection
  - Internal Calibrated RC Oscillator
  - External and Internal Interrupt Sources
  - Three Sleep Modes: Idle, Power-down and Standby
- I/O and Packages
  - 35 Programmable I/O Lines
  - 40-pin PDIP, 44-lead TQFP, 44-lead PLCC, and 44-pad MLF
- Operating Voltages
  - 2.7 - 5.5V for ATmega8515L
  - 4.5 - 5.5V for ATmega8515
- Speed Grades
  - 0 - 8 MHz for ATmega8515L
  - 0 - 16 MHz for ATmega8515

## Pin Configurations

Figure 1. Pinout ATmega8515

## Overview

The ATmega8515 is a low-power CMOS 8-bit microcontroller based on the AVR enhanced RISC architecture. By executing powerful instructions in a single clock cycle, the ATmega8515 achieves throughputs approaching 1 MIPS per MHz allowing the system designer to optimize power consumption versus processing speed.

## Block Diagram

Figure 2. Block Diagram

The AVR core combines a rich instruction set with 32 general purpose working registers. All the 32 registers are directly connected to the Arithmetic Logic Unit (ALU), allowing two independent registers to be accessed in one single instruction executed in one clock cycle. The resulting architecture is more code efficient while achieving throughputs up to ten times faster than conventional CISC microcontrollers.

The ATmega8515 provides the following features: 8K bytes of In-System Programmable Flash with Read-While-Write capabilities, 512 bytes EEPROM, 512 bytes SRAM, an External memory interface, 35 general purpose I/O lines, 32 general purpose working registers, two flexible Timer/Counters with compare modes, Internal and External interrupts, a Serial Programmable USART, a programmable Watchdog Timer with internal Oscillator, a SPI serial port, and three software selectable power saving modes. The Idle mode stops the CPU while allowing the SRAM, Timer/Counters, SPI port, and Interrupt system to continue functioning. The Power-down mode saves the Register contents but freezes the Oscillator, disabling all other chip functions until the next interrupt or hardware reset. In Standby mode, the crystal/resonator Oscillator is running while the rest of the device is sleeping. This allows very fast start-up combined with low-power consumption.

The device is manufactured using Atmel's high density nonvolatile memory technology. The On-chip ISP Flash allows the program memory to be reprogrammed In-System through an SPI serial interface, by a conventional nonvolatile memory programmer, or by an On-chip Boot program running on the AVR core. The boot program can use any interface to download the application program in the Application Flash memory. Software in the Boot Flash section will continue to run while the Application Flash section is updated, providing true Read-While-Write operation. By combining an 8-bit RISC CPU with In-System Self-programmable Flash on a monolithic chip, the Atmel ATmega8515 is a powerful microcontroller that provides a highly flexible and cost effective solution to many embedded control applications.

The ATmega8515 is supported with a full suite of program and system development tools including: C Compilers, Macro assemblers, Program debugger/simulators, In-circuit Emulators, and Evaluation kits.

## Disclaimer

Typical values contained in this data sheet are based on simulations and characterization of other AVR microcontrollers manufactured on the same process technology. Min and Max values will be available after the device is characterized.

## AT90S4414/8515 and ATmega8515 Compatibility

The ATmega8515 provides all the features of the AT90S4414/8515. In addition, several new features are added. The ATmega8515 is backward compatible with AT90S4414/8515 in most cases. However, some incompatibilities between the two microcontrollers exist. To solve this problem, an AT90S4414/8515 compatibility mode can be selected by programming the S8515C Fuse. ATmega8515 is 100% pin compatible with AT90S4414/8515, and can replace the AT90S4414/8515 on current printed circuit boards. However, the location of Fuse bits and the electrical characteristics differs between the two devices.

### AT90S4414/8515 Compatibility Mode

Programming the S8515C Fuse will change the following functionality:

- The timed sequence for changing the Watchdog Time-out period is disabled. See "Timed Sequences for Changing the Configuration of the Watchdog Timer" on page 51 for details.
- The double buffering of the USART receive registers is disabled. See "AVR USART vs. AVR UART – Compatibility" on page 134 for details.
- PORTE(2:1) will be set as output, and PORTE0 will be set as input.

## Pin Descriptions

<b>VCC</b>	Digital supply voltage.
<b>GND</b>	Ground.
<b>Port A (PA7..PA0)</b>	<p>Port A is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port A output buffers have symmetrical drive characteristics with both high sink and source capability. When pins PA0 to PA7 are used as inputs and are externally pulled low, they will source current if the internal pull-up resistors are activated. The Port A pins are tri-stated when a reset condition becomes active, even if the clock is not running.</p> <p>Port A also serves the functions of various special features of the ATmega8515 as listed on page 65.</p>
<b>Port B (PB7..PB0)</b>	<p>Port B is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port B output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port B pins that are externally pulled low will source current if the pull-up resistors are activated. The Port B pins are tri-stated when a reset condition becomes active, even if the clock is not running.</p> <p>Port B also serves the functions of various special features of the ATmega8515 as listed on page 65.</p>
<b>Port C (PC7..PC0)</b>	<p>Port C is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port C output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port C pins that are externally pulled low will source current if the pull-up resistors are activated. The Port C pins are tri-stated when a reset condition becomes active, even if the clock is not running.</p>
<b>Port D (PD7..PD0)</b>	<p>Port D is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port D output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port D pins that are externally pulled low will source current if the pull-up resistors are activated. The Port D pins are tri-stated when a reset condition becomes active, even if the clock is not running.</p> <p>Port D also serves the functions of various special features of the ATmega8515 as listed on page 70.</p>
<b>Port E (PE2..PE0)</b>	<p>Port E is an 3-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port E output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port E pins that are externally pulled low will source current if the pull-up resistors are activated. The Port E pins are tri-stated when a reset condition becomes active, even if the clock is not running.</p> <p>Port E also serves the functions of various special features of the ATmega8515 as listed on page 72.</p>
<b>RESET</b>	Reset input. A low level on this pin for longer than the minimum pulse length will generate a reset, even if the clock is not running. The minimum pulse length is given in Table 18 on page 44. Shorter pulses are not guaranteed to generate a reset.
<b>XTAL1</b>	Input to the inverting Oscillator amplifier and input to the internal clock operating circuit.
<b>XTAL2</b>	Output from the inverting Oscillator amplifier.

Notes: 1. Refer to the USART description for details on how to access UBRRH and UCSRC.  
2. For compatibility with future devices, reserved bits should be written to zero if accessed. Reserved I/O memory addresses should never be written.

3. Some of the status flags are cleared by writing a logical one to them. Note that the CBI and SBI instructions will operate on all bits in the I/O Register, writing a one back into any flag read as set, thus clearing the flag. The CBI and SBI instructions work with registers \$00 to \$1F only.

Package Type	
<b>44A</b>	44-lead, Thin (1.0 mm) Plastic Gull Wing Quad Flat Package (TQFP)
<b>40P6</b>	40-lead, 0.600" Wide, Plastic Dual Inline Package (PDIP)
<b>44J</b>	44-lead, Plastic J-Leaded Chip Carrier (PLCC)
<b>44M1</b>	44-pad, 7 x 7 x 1.0 mm body, lead pitch 0.50 mm, Micro Lead Frame Package (MLF)

## Packaging Information

### 44A

44-lead, Thin (1.0mm) Plastic Quad Flat Package  
(TQFP), 10x10mm body, 2.0mm footprint, 0.8mm pitch.  
Dimension in Millimeters and (Inches)\*  
JEDEC STANDARD MS-026 ACB

\*Controlling dimension: millimeter

REV. A 04/11/2001

40P6

40-lead, Plastic Dual Inline  
 Package (PDIP), 0.600" wide  
 Dimension in Millimeters and (Inches)\*  
 JEDEC STANDARD MS-011 AC

\*Controlling dimension: Inches

REV. A 04/11/2001

44J

44J, 44-lead, Plastic J-leaded Chip Carrier (PLCC)  
 Dimensions in Millimeters and (Inches)\*  
 JEDEC STANDARD MS-018 AC

\*Controlling dimensions: Inches

## Errata

The revision letter in this section refers to the revision of the ATmega8515 device.

### ATmega8515(L) Rev. B

There are no errata for this revision of ATmega8515.

## **Data Sheet Change Log for ATmega8515**

Please note that the referring page numbers in this section are referred to this document. The referring revision in this section are referring to the document revision.

### **Changes from Rev. 2512A-04/02 to Rev. 2512B-09/02**

1. **Changed the Endurance on the Flash to 10,000 Write/Erase Cycles.**

### **Changes from Rev. 2512B-09/02 to Rev. 2512C-10/02**

1. **Added “Using all Locations of External Memory Smaller than 64 KB” on page 29.**
2. **Removed all TBD.**
3. **Added description about calibration values for 2, 4, and 8 MHz.**
4. **Added variation in frequency of “External Clock” on page 38.**
5. **Added note about  $V_{BOT}$ , Table 18 on page 44.**
6. **Updated about “Unconnected pins” on page 62.**
7. **Updated “16-bit Timer/Counter1” on page 95, Table 50 on page 117 and Table 51 on page 118.**
8. **Updated “Enter Programming Mode” on page 181, “Chip Erase” on page 181, Figure 77 on page 184, and Figure 78 on page 185.**
9. **Updated “Electrical Characteristics” on page 194, “External Clock Drive” on page 196, Table 95 on page 196 and Table 96 on page 197, “SPI Timing Characteristics” on page 197 and Table 97 on page 199.**
10. **Added “Errata” on page 16.**
